

Problem 3. Stack Discipline (20 points)

Examine the following recursive function:

```
long sunny(long a, long *b) {
    long temp;
    if (a < 1) {
        return *b - 8;
    } else {
        temp = a - 1;
        return temp + sunny(temp - 2, &temp);
    }
}
```

Here is the x86_64 assembly for the same function:

```
0000000000400536 <sunny>:
400536: test    %rdi,%rdi
400539: jg      400543 <sunny+0xd>
40053b: mov     (%rsi),%rax
40053e: sub     $0x8,%rax
400542: retq
400543: push    %rbx
400544: sub     $0x10,%rsp
400548: lea     -0x1(%rdi),%rbx
40054c: mov     %rbx,0x8(%rsp)
400551: sub     $0x3,%rdi
400555: lea     0x8(%rsp),%rsi
40055a: callq   400536 <sunny>
40055f: add     %rbx,%rax
400562: add     $0x10,%rsp
400566: pop     %rbx
400567: retq
```

Handwritten notes for assembly:

- $rdi = 3$
- $rsi = \text{fact}$
- $rax = rax - 8$
- $rbx \rightarrow \text{stack}$
- $rsp - 10$
- $Rbx = Rdi - 1$
- $rsp + 8 = rbx$
- $rdi = rdi - 3$
- $rsi = 0 = rsp + 8$
- $rax = rax + rbx$
- $rsp + 10$
- $rbx \leftarrow \text{stack}$
- $rbx = 4$
- $rbx = \text{temp}$

We call `sunny` from `main()`, with registers `%rsi = 0x7ff..ffad8` and `%rdi = 6`. The value stored at address `0x7ff..ffad8` is the long value 32 (0x20). We set a breakpoint at "`return *b - 8`" (i.e. we are just about to return from `sunny()` without making another recursive call). We have executed the `sub` instruction at `40053e` but have not yet executed the `retq`.

Fill in the register values on the next page and draw what the stack will look like when the program hits that breakpoint. Give both a description of the item stored at that location and the value stored at that location. If a location on the stack is not used, write "unused" in the Description for that address and put "-----" for its Value. You may list the Values in hex or decimal. Unless preceded by `0x` we will assume decimal. It is fine to use `f..f` for sequences of `f`'s as shown above for `%rsi`. Add more rows to the table as needed. Also, fill in the box on the next page to include the value this call to `sunny` will finally return to `main`.

Register	Original Value	Value at Breakpoint
<code>rsp</code>	<code>0x7ff..ffad0</code>	<code>7ff..ffad0</code>
<code>rdi</code>	6	3
<code>rsi</code>	<code>0x7ff..ffad8</code>	<code>7ff..ffad8</code>
<code>rbx</code>	4	4
<code>rax</code>	5	2

DON'T FORGET → What value is finally returned to `main` by this call?

2

Memory address on stack	Name/description of item	Value
<code>0x7ff..ffad8</code>	Local var in <code>main</code>	<code>0x20</code>
<code>0x7ff..ffad0</code>	Return address back to <code>main</code>	<code>0x400827</code>
<code>0x7ff..ffac8</code>	<code>rbx</code>	5
<code>0x7ff..ffac0</code>	<code>sp</code>	<code>ff..ad0</code>
<code>0x7ff..ffab0</code>		
<code>0x7ff..ffab0</code>		
<code>0x7ff..ffaa8</code>		
<code>0x7ff..ffaa0</code>		
<code>0x7ff..ffa98</code>		
<code>0x7ff..ffa90</code>		
<code>0x7ff..ffa88</code>		
<code>0x7ff..ffa80</code>		
<code>0x7ff..ffa78</code>		
<code>0x7ff..ffa70</code>		
<code>0x7ff..ffa68</code>		
<code>0x7ff..ffa60</code>
