Problem 1. (3+3+2+5+2+5 points):

The following problem concerns the way virtual addresses are translated into physical addresses.

- The memory is byte addressable.
- Memory accesses are to **1-byte words** (not 4-byte words).
- Virtual addresses are 16 bits wide.
- Physical addresses are 13 bits wide.
- The page size is 512 bytes.
- The TLB is 8-way set associative with 16 total entries.
- The cache is 2-way set associative, with a 4 byte line size and 16 total lines.

In the following tables, **all numbers are given in hexadecimal**. The contents of the TLB, the page table for the first 32 pages, and the cache are as follows:

TLB				Page Table

Part 1

- A. The box below shows the format of a virtual address. Indicate (by labeling the diagram) the fields (if they exist) that would be used to determine the following: (If a field doesn't exist, don't draw it on the diagram.)

<i>VPO</i>	The virtual page offset
<i>VPN</i>	The virtual page number
<i>TLBI</i>	The TLB index
<i>TLBT</i>	The TLB tag

- B. The box below shows the format of a physical address. Indicate (by labeling the diagram) the fields that would be used to determine the following:

<i>PPO</i>	The physical page offset
<i>PPN</i>	The physical page number
<i>CO</i>	The block offset within the cache line
<i>CI</i>	The cache index
<i>CT</i>	The cache tag

Part 2

For the given virtual address, indicate the TLB entry accessed, the physical address, and the cache byte value returned **in hex**. Indicate whether the TLB misses, whether a page fault occurs, and whether a cache miss occurs.

If there is a cache miss, enter “-” for “Cache Byte returned”. If there is a page fault, enter “-” for “PPN” and leave parts C and D blank.

Virtual address: 20AD
